which the strangers are believed to bring with them. The whole place, according to the idea of the Indians, has become infected as it were by the new-comers. Besides, the Indians understand that one party of white men is soon followed by another.

It is natural that the Chaco Indians should not care to bestow great labour on dwellings which in all probability will house them only for a short time, or in general, to arrange their life more comfortably in a place which they will probably soon be obliged to desert for ever. Apart from this, the Chaco Indian, who is perfectly suited to his environment, constructs his houses precisely in the way he thinks is most practical and of the material which is most easily obtainable. In the interior parts of the Chaco there are no large trees affording material for the construction of more substantial and durable houses. On the other hand, the scraggy trees and bushes in which the Chaco forests abound and the grassy plains provide building material in abundance, always within reach and excellent for the needs of the Indians. The beehive shaped huts of the primitive Chaco tribes therefore do not, as a certain ethnological school asserts, represent a type of human dwelling essentially characteristic of tribes at the lowest stages of cultural development, but must be wholly explained by the natural conditions. Like the Fuegians, who in their general culture are closely related to the Chaco tribes, the latter are not, on the whole, any lower in the scale of human development than most other tribes in tropical or sub-tropical South America, although nature may allow these to construct habitations of a higher type.

The same reasoning evidently accounts for the fact that the Pilcomayo tribes, although they are dependent on the river and to a great extent subsist by fishing, do not use canoes or craft of any kind. Whereas »dug-outs» of the kind customary among the South American Indians are commonly used by the Lenguas and other tribes of the river Paraguay, the Choroti, Mataco, Tobas, and Ashluslay have not even thought of constructing such vessels, obviously because the large timber trees from which canoes could be dug out are not obtainable in their country.

I have mentioned that agriculture is only practised by the Chaco tribes on a very limited scale, which of course is due to the dryness of the climate. Among all tribes the land is common property, and within this territory each family has a small plot of land allotted to it, or once taken possession of, which they are supposed to possess as long as they actually cultivate it. Pumpkin, *santia* (water melon), and beans are the principal crops of the Choroti; maize and manioc are also cultivated, but the drought
